

Be Smart About “Going Green” ...

Engineered Control Services – What We Do

- We provide residential and commercial customers an evaluation of the overall energy efficiency of their home or business by measuring energy loss using infrared technology – the only way to truly gauge the hidden, energy condition of your home or office.
- We provide both thermographic imagery and a clear, easy to understand report on the major sources of energy loss, allowing you to target energy investments wisely.

Infrared Inspection – Why You Need It

- Before buying, constructing, or upgrading your home's energy infrastructure (windows, doors, insulation, HVAC, etc.), call ECS for a targeted, infrared assessment of your home or office as you take the following information into consideration:

- Most problems are sight unseen...they exist behind the drywall:
 - Energy loss caused by damaged or missing insulation
 - Leaking doors and windows
 - Defective AC-system insulation
 - Leaking water and sewer pipes
 - Faulty electrical installation

- If you have already planned to replace your windows & doors, etc., but cannot do replace them all at once, call ECS – our assessment tells you which areas are the least efficient and as such will give you the biggest “bang for your buck”. Plus: the government wants you to improve your home's energy efficiency. They offer significant Tax Credits for companies and individuals who invest in energy solutions.

***In this economy, be smart with your home improvement budget.
